SUBJECT: Insulation Requirements for Primary Condensate Drains

At its meeting of October 20, 2005 the Board approved an interpretation of Sec. 307.2.5 of the Florida Mechanical Code (FMC). This section states “All horizontal primary condensate drains within unconditioned areas shall be insulated to prevent condensation from forming on the exterior of the drain pipe.”

Questions have been raised about the code requirement to insulate condensate drains that were installed vertically or at an angle (pitched). All condensate drain lines are required to have a slope to insure proper drainage and therefore are not perfectly horizontal. The code does not address the insulation of condensate drain lines that are installed vertical or at an angle (pitched). It appears the intent of the code was to apply to condensate piping which is installed in a relatively horizontal manner.

Formal Interpretation:

Only primary condensate drain lines within unconditioned areas installed in a relatively horizontal manner are required to be insulated.
