Hazardous wastes spilled or dumped on the ground or disposed in dumpsters may seep into the groundwater and contaminate drinking water supplies. Hazardous wastes may run off into the nearest body of water where they may poison or kill fish and other wildlife. Hazardous wastes pose a risk to you, your employees and your community. State and county inspectors may visit your business to ensure that hazardous wastes are being managed properly. State penalties range from $100 to $50,000 per violation per day.

Reducing hazardous wastes can reduce your production and disposal costs and reduce your risk of future liability.

Your customers will appreciate your efforts to prevent pollution. Your community will recognize your business as a good neighbor.

**Health and Environment**

Hazardous wastes spilled or dumped on the ground or disposed in dumpsters may seep into the groundwater and contaminate drinking water supplies.

Hazardous wastes may run off into the nearest body of water where they may poison or kill fish and other wildlife.

Hazardous wastes pose a risk to you, your employees and your community.

**Cost Savings**

State and county inspectors may visit your business to ensure that hazardous wastes are being managed properly. State penalties range from $100 to $50,000 per violation per day.

Reducing hazardous wastes can reduce your production and disposal costs and reduce your risk of future liability.

**Public Image**

Your customers will appreciate your efforts to prevent pollution.

Your community will recognize your business as a good neighbor.
What is a hazardous waste?

A waste is hazardous if:
- It is listed as a hazardous waste in the Title 40 Code of Federal Regulations (CFR) Part 261, Subpart D.
- It has any of the characteristics described below:

### Characteristic Wastes

#### Ignitable
Ignitable wastes are flammable or spontaneously combustible. If they have a flashpoint of less than 140 degrees Fahrenheit or an alcohol content of 24% or more, they are hazardous wastes. Examples include some paints, paint solvents, other solvents and degreasers.

#### Corrosive
Corrosive wastes can burn the skin or corrode metals. Liquids with a pH of 2 or lower or 12.5 or higher are corrosive. Examples include rust removers, acidic or alkaline fluids and battery acid.

#### Reactive
Reactive wastes are unstable and may explode or react violently with water or other materials. Examples include bleaches, oxidizers, cyanides and explosives, such as sodium azide and dynamite.

#### Toxic
Wastes are toxic if they contain certain heavy metals above specific concentrations, such as chromium, lead or cadmium, or toxic organic chemicals. Examples include some parts cleaners and chromium-bearing paints.

Listed Wastes

Some industrial processes and chemical wastes are listed specifically as hazardous in the federal regulations under 40 CFR 261, Subpart D. Copies of the rule can be found at many public libraries, on the internet (http://www.access.gpo.gov/nara/cfr/) or may be purchased from the Government Printing Office.

Acutely Hazardous Wastes

Small amounts of very dangerous wastes, such as arsenic and cyanide compounds, are regulated in the same way as large amounts of other wastes. A business that generates 2.2 pounds (1 kilogram) or more of these acutely hazardous wastes per month is subject to full regulation under the hazardous waste rules.

Identifying Your Hazardous Wastes

It is very important to determine whether a waste is hazardous or non-hazardous. There are several ways to identify hazardous wastes:
- Always ask for a Material Safety Data Sheet (MSDS) before ordering any new product. The MSDS will give you valuable information about the product. Note: the MSDS does not identify chemicals present in concentrations less than 1%, or 10,000 parts per million.
- Talk to product suppliers and manufacturers.
- Read product labels.
- Compare product and process information to hazardous waste characteristics and to wastes listed in federal regulations.
- If product or process information is not available or is inconclusive, have a commercial lab sample and test the waste using the TCLP test or other appropriate analytical tests.
- A non-hazardous material or product may become a hazardous waste due to contaminants added during use. Lab testing may be necessary.
Sources of Hazardous Waste

Fabrication

Gelcoat and Resin Applications

Excess gelcoat, which is about 35% styrene, and other resins are primary sources of hazardous waste. Resin wastes can be minimized with equipment that has greater transfer efficiency. Reducing waste saves money and makes cleanup easier.

Liquid Wastes

Some of the most common solvents used for cleaning equipment, hands and resins are hazardous. Examples include acetone, mineral spirits, paint/lacquer thinners and solvent distillation bottoms from solvent recovery units.

Solid Wastes

Hazardous solid wastes may include unsolidified resins, excess putty and adhesives that have not hardened, solvent distillation bottoms from solvent recovery units, spray booth filters and solvent-contaminated towels, wipes and rags.

Cleanup

Rags contaminated with used oil or solvents may be a hazardous waste. If your shop washes rags, water must be discharged to a publicly owned sanitary sewer, not a storm sewer, septic tank or cesspool. If you use a towel service, make sure the company discharges its water to a publicly owned sewer system. Disposable rags or paper towels used with hazardous substances should be disposed as hazardous wastes. They should not be disposed in the dumpster.

Typical Hazardous Wastes

Styrene

A primary component of gelcoat and other polyester resins.
Flash point: 90°F
Corrodes copper.
Affects the central nervous system, lungs and skin.

Methyl Ethyl Ketone Peroxide (MEKP)

May be explosive.
Flash point: 185°F
May react strongly with other substances. Refer to MSDS. Incompatible with very strong oxidizers, acids and bases. Skin and nose irritant. Can cause blindness. Affects the central nervous system.

Acetone

Flash point: 0°F
Incompatible with acids and oxidizers.
Irritant for eyes, nose, throat and skin.
Central nervous system depressant.

Acetone Substitutes

Various high flash point acetone substitutes are available, such as propylene carbonate and dibasic ester (DBE). However, the spent material may be ignitable due to mixture with ignitable resins and gelcoats. If you change your process to use an acetone substitute, waste should be tested prior to disposal.
How should I manage hazardous wastes?

First, determine how much hazardous waste you generate each month. The rules you must follow depend on how much you generate, how much you store and how long you store it.

Less than 220 pounds (100 kilograms or about half a drum): you are a “Conditionally Exempt Small Quantity Generator” (CESQG).

220 - 2,200 pounds (100-1,000 kilograms or about half a drum to 5 drums): you are a “Small Quantity Generator” (SQG).

More than 2,200 pounds (1,000 kilograms or more than about 5 drums): you are a “Large Quantity Generator” (LQG).

The following practices may be required for your business. Even if they are not required, they are good waste management practices. Additional information is available from FDEP.

Containers

- Maintain containers in good condition. Prevent leaks, ruptures and accumulation of rainwater on tops of drums.
- If a container leaks, transfer waste to a new container.
- Keep containers closed. Use self-closing funnels when adding waste. Do not allow wastes to evaporate; this is a serious offense.
- Wastes must be compatible with the container. For example, use HDPE plastic containers for corrosive wastes.
- Never place incompatible wastes, such as wastes that react with each other (e.g., acids and bases) in the same container.

Storage

- Maintain adequate aisle space between container rows to allow inspection for leaks and damages.
- Store ignitable and reactive wastes at least 50 feet from property boundaries.
- Store containers with incompatible wastes in separate areas.
- Time limit for SQGs is 180 days. It is 90 days for LQGs.

Inspections and Recordkeeping

- Inspect containers at least once a week and keep a written log of container inspections.
- Keep a record of larger spills and use this information to identify the spill prevention options that might help your business.
- Keep training and inspection records for three years.
- Keep manifests and shipping receipts for three years.
- Keep records of lab tests for three years.
- Keep land disposal restriction forms for three years from the date the waste was last shipped.

Training

- Train all personnel to identify, reduce and properly handle wastes.
- Train new employees before they handle hazardous wastes.
- Inform employees of the importance of pollution prevention.
How can I reduce hazardous wastes?

Reducing hazardous wastes makes good business sense. Benefits include:

- Saving money on waste management costs.
- Reducing concerns about penalties and liability.
- Creating a safer, healthier workplace.
- Promoting positive public relations with clients, customers and the local community.

Where to begin

- Make a commitment to reducing wastes in every area of your business.
- Evaluate your shop’s wastes and identify areas where changes can be made.
- Encourage the participation of all employees through education, training and incentives.

Solvents

- Reduce solvent waste by replacing solvent only when necessary.
- Replace organic solvents with emulsifiers.
- Replace acetone and other solvents with non-hazardous solvents, such as propylene carbonate, or less hazardous solvents, such as dibasic ester (DBE).
- Recycle solvent wastes on-site in a distillation unit and reuse them.
- Reduce solvent rinse usage by using squeegees to remove excess resins.
- Use a two-stage cleaning process (dirty solvent followed by clean rinse) to reduce solvent usage.
- Use self-closing funnels to add waste to containers.

Training

- Train new employees to use solvents and chemicals efficiently, using minimal amounts to get the job done.
- Ensure that employees follow label directions and precautions listed on Material Safety Data Sheets (MSDS).

Fabrication

- Reduce resin waste by using flow cutters, air-less sprayers and power rollers.
- Consider using non-spray resin application methods.
- Reduce overspray by changing spray orientation.
- Replace high-pressure air systems with air-less or air-assisted equipment to reduce fogging, overspray and bounceback.
- Prevent contamination of resin buckets.

Shop Practices

- Minimize inventory and use a “first-in, first-out” system to prevent the need for disposal of old, unused materials.
- Store raw materials and wastes in closed containers in a covered area protected from rain and sunlight.
- Use drip trays under solvent storage drums.
- Prevent leaks and spills. Keep floors clean.
- Use the least hazardous type of floor cleaner available.
- For dirty rags, use an approved laundry service that discharges its water to a publicly owned sewer system.
- Do not discharge wastes to the ground surface. Plug floor drains.
Who needs to know if my business generates hazardous waste?

Post Emergency Information
Post the following information near every telephone:
- Fire department phone number.
- Emergency coordinator’s name and phone number.
- Locations of fire alarms and extinguishers.
- Locations of spill control materials.

Notify FDEP
If your business is a small or large quantity generator, notify FDEP to obtain a US EPA identification number. Local environmental agencies also should be notified.

Notify local authorities
Police and fire departments and local hospitals that would respond to an emergency need to know that there are hazardous wastes on your property.

Designate an emergency coordinator
This person must know what to do in case of fire, spill or other emergency and must be on the premises or on call 24 hours a day.

Develop a contingency plan
Guidance on contingency plans is available from FDEP. Large quantity generators must have a written plan that includes:
- Emergency response arrangements with police and fire departments, hospitals and emergency response contractors.
- Emergency coordinator’s address and phone number.
- On-site emergency equipment descriptions and locations.
- Evacuation plan and routes, including a site diagram.
- Spill reporting procedures.

Smaller generators (SQGs and CESQGs) also should have a contingency plan.

Dos and Don’ts

**DO**
- Keep containers closed
- Keep accurate inspection logs
- Label all containers

**DON’T**
- Leave containers open
- Leave containers unlabeled
The most common violation is the non-determination of whether something is a waste. Abandoned products are wastes. If you throw away containers, make sure the container is completely empty and rinsed before you place it in a waste receptacle. If you throw away aerosol cans, make sure the can has a hole in it, and that you have drained the liquids out of the can. If you are throwing away paint containers, be sure to drain all the paint out of the container.

The only generators who are allowed to transport their own waste are conditionally exempt small quantity generators. All other generators must use a hazardous waste hauler that has a permit from the FDEP and the US EPA.

The most common violation is the non-determination of whether something is a waste.

Abandoned products are wastes.

If you throw away containers, make sure the container is completely empty and rinsed before you place it in a waste receptacle. If you throw away aerosol cans, make sure the can has a hole in it, and that you have drained the liquids out of the can. If you are throwing away paint containers, be sure to drain all the paint out of the container.

If you discharge any waste that could be construed as a hazardous waste into a city sewer, you must have the written permission of the city sewer system. The city sewer system must be a Publicly Owned Treatment Works (POTW). It cannot be a privately owned package plant.

If you use rags, you should send the rags to a linen service that is served by a publicly-owned sewage treatment plant. If you use paper towels, you must make a determination as to whether the used paper towels are a hazardous waste.

Know where your drains go. All drains that lead from a hazardous materials area to a stormwater area should be sealed shut.

Drums

- You cannot have any mystery drums. All drums must be labeled and have a “birthdate” on them.
- Evaporation of hazardous waste is a serious violation. Do not allow the hazardous wastes to evaporate. When you are not in the process of putting waste into the drum, you must keep it closed.
- You also are required to keep the top of the drum clean.
- Do not store old drums outside. If they get stormwater inside them, you will have to sample the stormwater and determine whether the water in the drum is hazardous. Insist that the person who sold you the drum and its contents takes the drum back when you are done with it.
- Inspectors go into dumpsters and walk the entire property line of a business. They go back into trees looking for orphan drums and distressed/dead vegetation.

Spills

- Clean up your spills at the time of the spill.

Transport

Water
Additional information on hazardous waste reduction and regulations is available from many sources.

**Florida Department of Environmental Protection**
District offices and the Tallahassee office offer technical assistance, fact sheets and other publications on hazardous waste regulations.

Hazardous Waste Compliance Assistance Program  
Phone: (800) 741-4DEP  
(850) 245-8707  
Fax: (850) 245-8810

Available publications include:  
- Summary of Hazardous Waste Regulations  
- Requirements for Conditionally Exempt Small Quantity Generators  
- Requirements for Small Quantity Generators  
- Handbook for Small Quantity Generators of Hazardous Waste

**U.S. Environmental Protection Agency**
The US EPA has published a series of industry-specific guidelines and handbooks on preventing pollution and complying with hazardous waste regulations.

RCRA Hotline: (800) 424-9346

**Your Trade Associations**
Many trade associations have published guides to help you find solutions to your hazardous waste management problems.

**Florida Small Business Assistance Program**
The Small Business Assistance Program helps businesses with environmental concerns and problems related to compliance with air regulations. Assistance is confidential and staff experts have business experience.  
Phone: (800) 722-7457
This project and the preparation of this booklet were funded in part by a Section 3011 Hazardous Waste Management State Program grant from the U.S. Environmental Protection Agency (US EPA) through a contract with the Hazardous Waste Management Section of the Florida Department of Environmental Protection. The total cost of the project was $45,000, of which $45,000 or 100 percent was provided by the US EPA.
